Description
    Hello,

    I do miss one feature which prevents me to fully dedicate myself to using/migrating-to Tiki and I
    believe it is especially important for those users wanting to work on the content offline using their
    preferred editor and e.g Markdown plugin...

    Let's take example of Tiki's Features page - beautiful page with many image. The only problem
    which I see is that the links for images are completely separated from the content itself, iow. there
    is no semantical link between the content and the image since e.g. link for the Wiki section does not
    show any connection text and the image.

    Let's compare it with e.g Grav - Flat File CMS and one of the demo skeletons...

    If we visit one post, we can inspect the URL for one of the associated images which clearly tells us
    that the image is associate with certain post.

    Furthermore, (Grav) user can write such post online, but also offline using "standard" Markdown
    syntax and keep the images in the same folder as the post itself - I already wrote about it in my post
    to devel-list. - using simple syntax:

    ![Photo19](photo19.jpg)

    The same thing would happen when using one of many static-site-generators...

    Suppose, that I'm about to write a series articles/post about Vedic math...the subject requires using
    math symbols, lot of diagrams etc. which requires lot of time and is not suitable task for online
    editor without proper syntax high. support, auto-completion etc.

By using elFinder I can drag&drop the whole folder with e.g. images from my desktop to the tiki, I can also write the whole content offline using my preferred editor using Markdown, but the things break when I need to reference images in the content. 🙁 since the URL to be used within Wiki will become something like:

{img fileId="9"}

So, I'm interested whether:

1. my proposal does have any appeal to Tiki devs

1. is it difficult to modify Tiki codebase to enable one to somehow mimic filesystem's folder/hierarchy so that if we upload image to blog-1/post-1/post-1-image.png then it would be possible to e.g. use the following Markdown syntax:

![Image 1 for post 1](blog-1/post-1/post-1-image.png)

to reference it?

Sincerely,
Gour

Are you using Wiki page attachments `feature_wiki_attachments` and "Use file galleries for wiki attachments" `feature_use_fgal_for_wiki_attachments`?
I know it doesn't do the "semantic" thing but does keep all the images etc for a wiki page together in one place.

> Are you using Wiki page attachments feature_wiki_attachments and "Use file galleries for wiki attachments" feature_use_fgal_for_wiki_attachments?

Yes, but few problems here...

1. iirc, firsts it is available only for wiki pages and not for blog posts or articles.

2. afaict, it is related only for *attachments" while I'm interested for media which is part of the page itself and do not understand how "does keep all the images etc for a wiki page together in one place."?

3. "semantic thing" would be nice and since elFinder allows drag&drop from the desktop to the Tiki, it would be great to have influence on the syntax for referencing media based on its organization within File Gallery.
I know it doesn't do the "semantic" thing but does keep all the images etc for a wiki page together in one
place.
