Description

Selecting pages in the 1.9 result in the blank page. It takes several refreshes to get a page to come up. To my knowledge, none of the log files contains any error messages.

Everything was fine while I had 1.8.6 version. After upgrade to 1.9.3.1, I constantly have issues with blank pages and no error messages anywhere. Upgrade 1.9.4 didn't improve anything. It typically takes 2 to 3 refreshes to get the page. For any production site this would be a mission critical problem.

Solution

Raise your PHP memory_limit as explained in the install docs.

I have the same experience with a system running on a client with easyphp. Tiki-Version is 1.9.3:
Often not all modules are loaded: Message module deoes not exist.
Often: Some refreshes needed to get the page
Ever: no error message in any log.

viksicom 27 Jun 06 18:57 GMT-0000

I changed php memory_limit to 16M and it solved my problem. It is still an issue for the co-hosting environments, where one may not have access to the global PHP settings.
I am concerned that tikiwiki may turn into resources hog in the near future.

DrStrangePork 18 Aug 06 15:49 GMT-0000

I already have my memory_limit set to 16M, but I still get blank pages for everything. Even my tiki-install.php page, after the first time I set my DB options, results in a blank page. I also have no errors in any logs.

DrStrangePork 18 Aug 06 16:07 GMT-0000

Somehow I missed installing php-mysql. I installed it, and my Tiki is working now
