Description
- It is not possible using the HTML plugin or the wiki syntax to have bootstrap modals as explained at:
  - https://getbootstrap.com/docs/4.0/components/modal/

  The page turn black/faded and the modal is displayed below the modal-backdrop (without the modal id).

  Note: I have the feeling it was possible in the past (19, 20, 21). May be it is a recent change that has been merged into Tiki 21.

Demonstrate Bug (Tiki 19+)

  This bug has been demonstrated on show2.tikiwiki.org

Ticket ID
Not sure what you mean by "directly" but this should work in a wiki page (or here hopefully ;)

This div is collapsible, thanks.

(sorry, just read you said modals, not collapsibles... 1 sec)

Like this maybe?

new test tracker item

The modals for tracker item relied on Tiki code, I use and they work.

I can’t make this https://getbootstrap.com/docs/4.0/components/modal/#live-demo work.

Just to open a dialog on click. I’m dam sure I used that but now it is under the faded background, no matter what I try with the z-index.

PS: by directly I mean grab the code from bootstrap doc and paste it between HTML wiki plugin tags or convert to wiki syntax.
