Description

Reviewed with Tiki25

~~If the auto-assign is set to "Creator" and the admin edit an existing item with a null username (creator deleted, error with duplicate feature, etc), the admin username will be assigned and saved. This can happen even if admin doesn't see the field (if he use a modal to modify some preferences or part of the item).~~

Not able to reproduce anymore, may have been fixed

If the admin duplicate an item that has a another user selected in a user selector field, the new item (the clone) will be saved with the admin for user.

Sorry, i don't understand your description properly @**Bernard Sfez / Tiki Specialist**, for me creating a user without setting the user (as admin) creates an item without a user set, only by duplicating a user as admin do i get the username change to admin.

Admins (including tracker admins i think) can create and edit user items for whomever they like (including none if the field isn't mandatory).

I changed the password to 12345 and added some perms for registered, then switched user to papa1, created an item which was correct, and edited an admin's item which was also fine.

So for me it's only admins duplicating items that has the bug... is that correct?

Thanks!

So for me it's only admins duplicating items that has the bug... is that correct?

As I understand it now it is more like conflict of 2 features than a full bug.

As the admin duplicate the item it turn to be the "creator" (of the clone). While this is logic due to the code, it is unlikely what the admin wanted to do (change the user of the item he is duplicating).

I clarified and changed to feature request to avoid change of behavior (may be someone is happy with

this).

A switch should be available in the user selector (like we have now for the item link) to avoid such change.
