Description

On a Tiki23 I create a first article in "en" then create a "he" translation (new article) with everything in hebrew but nothing in the body (using title and header field).

On save I have a WSoD.

If I refresh the page everything is here.

If I add a body (no hebrew in it, just an image) I got a Tiki system error:

System error. חזרה הודעת שגיאה זו: Incorrect string value: '\xD7' for column

`bernardsfez_tiki23`.`tiki_objects`.`description` at row 1 The query was: update `tiki_objects` set `description`=?, `name`=?, `href`=? where `objectId`=? Values: להתאים את סביבת עבודה בדיוק
tiki-read_article.php?articleId=66 226

The article is saved and visible (while something seems weird in the display)

I tried to check if they were invisible characters or some specific word or letter that cause the issue and I couldn't find.

If I take the same text and remove it from the Heading to paste it in the body, it is working as expected.

It couldn't be reproduced on the show instance so I checked my database setting.

In my (Virtualmin) configuration file (my.cnf) I added :

```
[client] default-character-set=utf8mb4 [mysql] default-character-set=utf8mb4
```

MariaDB System Variables look good:

```
character_set_client utf8mb4 character_set_connection utf8mb4 character_set_database utf8mb4
character_set_filesystem binary character_set_results utf8mb4 character_set_server utf8mb4
character_set_system utf8 character_sets_dir /usr/share/mysql/charsets/ check_constraint_checks
ON collation_connection utf8mb4_general_ci collation_database utf8mb4_general_ci
collation_server utf8mb4_general_ci
```

Comments

Working fine on Tiki24 (tiki23 is outdated)

Saw this on Tiki25, or I closed prematurely or it came back.

This error is displayed, the article is saved.
