## Comments

**hman** 27 Nov 21 15:45 GMT-0000

Happens with unmodified Geo as well...

**Gary Cunningham-Lee** 27 Nov 21 15:48 GMT-0000

What do you mean by "unmodified Geo"? Do you mean a version that's made for Tiki 18? Can you try with another theme, such as the Default theme? Thanks.

**hman** 27 Nov 21 16:54 GMT-0000

Yes, I tried you original version.

**hman** 27 Nov 21 16:58 GMT-0000

Happens with built-in Amelia as well...

Gary Cunningham-Lee

27 Nov 21 17:12 GMT-0000

Well then, it's not a CSS issue, or anyway not theme-specific. Does it happen with every event?

It seems to me that if this were a bug in Tiki's code, certainly it would have been noticed long ago. We use Calendar events at tiki.org, for example, and didn't see this while the site was running on Tiki 18, not did we receive any reports from other users of Tiki 18 that I'm aware of, so I'm wondering if there's something unusual in the event description, or is it plain text.

hman 27 Nov 21 17:59

GMT-0000

Plain text... But the calendar feature is so filled with bugs. See below. I cannot create ANY test event in the show instance. WSOD, even when I try to create a single event (no recurrence rule whatsoever). White screen of death every time. Calendar is dysfunctional altogether.

hman 27 Nov 21 17:28 GMT-0000

Created show instance. Switched it to classic 3 container. Created calendar. Upon creating a weekly test event: WSOD... Repeated creation of test event (weekly, every Saturday, 4 occurrences, all-day event), WSOD again. I'm going nuts over this #\*\$&/\*\$&β (paste your favorite curse here 🤪 ) calendar...

**hman** 27 Nov 21 18:30 GMT-0000

Server check on the show instance. Some observations:

character\_set\_database utf8 unsure On a fresh install everything should be set to utf8mb4 to avoid unexpected results.

...this maybe due to the way show instances are created...

collation\_database utf8\_unicode\_ci unsure On a fresh install everything should be set to utf8mb4 to avoid unexpected results.

...see above...

session empty unsure The session is empty. Try reloading the page and, if this message is displayed again, there may be a problem with the server setup.

exec Enabled risky Exec can potentially be used to execute arbitrary code on the server. Tiki does not need it; perhaps it should be disabled.

passthru Enabled risky Passthru is similar to exec. Tiki does not need it; perhaps it should be disabled. However, the Composer package manager used for installations in Subversion checkouts may need it.

PHP version 7.4.22 good This version of PHP is recent. Tiki 18.x LTS might work with this version of PHP.

That is incorrect! Tiki 18.8 won't run on PHP 7.4, there are problems with trackers (see my bug report on that which some of you think is invalid. Now you fall over your own feet with this...). And: PHP 7.4 is not recent, 8 is... 7.4. is still supported (until end of 2022), but it's not recent. Running 18.8. on PHP 7.4 will result in Fatal error: Uncaught Error: Cannot pass parameter 2 by reference in tiki-view\_tracker.php:529 Stack trace: #0 {main} thrown in tiki-view\_tracker.php on line 529

**Gary Cunningham-Lee** 27 Nov 21 19:01 GMT-0000

Heh, I installed Tiki 18 locally to test this but the installer couldn't connect to the database — the PHP here is also 7.4 :-| .

**hman** 27 Nov 21 20:00 GMT-0000

My installation runs on 7.2 now, but that costs me 8,90 Euro per month extra...

The show instance throws other errors, too:

**hman** 27 Nov 21 21:07 GMT-0000

I made another test. The show instance's calendar isn't working, so I used mine. I found a dependency of the bug to the content of the event. But it's NOT whether it is plain text or not: The bug only shows on events that span an entire day!

If an event has a beginning and an end, the bug doesn't show... If "all day" checkbox is checked, the layout is broken...

In both cases, tiki-calendar\_edit\_item.php?viewcalitemId=NN is called, just with a different 'NN'.

**hman** 28 Nov 21 10:06 GMT-0000

While looking for a possible cause of this, I discovered that something else is wrong: The left module zone is there (the space looks reserved,

and the separation border line is there, but the left module zone is completely empty.... Top zone is there, bottom and page button also, but no left zone content (in my case, this would be the Tiki menu).
