Description
When you create trackers with lots of entries (like cataloging newspaper articles) you will soon find that Tiki's sorting options are far (!) too limited. There is just one sorting option. A second is implied, but undocumented (either it's creation date or it is ID, could not find out).

It would be a significant improvement (and VERY easy to create in SQL) if a second and third sort option could be integrated just like the first one: Select field, select order.

These should be hierarchical, so all elements should first be sorted by option 1, and within all results sorting should be by option 2.

So for the newspaper archive example: First sort by category/department/column (alphabetically ascending), and within that by page number (numerically ascending), and on page number by title (alphabetically ascending). Just like Excel does.

These must be three separate options with both field and order selection, do not make it a multiselect, because you might want to have differing sort orders for separate fields...
