Description

Note that the "Clone tracker items" option name has been changed for "Duplicate tracker items" in Tiki25.

On tracker control panel it is possible to enable the option "Duplicate tracker items (Allow copying tracker item information to a new tracker item. ) "

When duplicating an item, if this item is used in another tracker through an item link the "children" items will be duplicate too. Victor [] ported to my attention that this code/feature is here since 2012. While it was added 10 years ago and trackers or tracker usage complexity has greatly improved and changed, other people may be using it this feature as is. (so it need to be preserved)

The code is shared and used by the clone_tracker_item of the pluginListExecute.

I see several issues;

1. This is transparent and the user is not aware of this silent multiplication of items .
2. Some information are not added to the duplication (like the category)
3. Fields with automatic value assignment may received an unwanted (or unexpected) value. (user-selector creator or last editor will be filled automatically).

Here an video to illustrate the issue;
On tracker A I have a product. On tracker B I have 12 orders with an item link to the products in the tracker A.

After I duplicate a single product in tracker A, it will create also a duplicate for each item it is link to so now I have 24 new product items and as the tracker use a user selector field set to creator, admin is now the value of the field.

**Duplicate Trackeritem Create Children**

To answer the problem we need to discuss and have a consensus.

- We need a new option for the user to select if only the targeted item should be duplicated (new behaviour) or if the targeted items + all children should be duplicated (as it is today).
- Where the option selection should be set ?
  - Option1: As it is related to the Duplicate tracker items it should be a child preference of the option on the control panel : tiki-admin.php?page=trackers but then it will be trackers wide
  - Option2: As it related to the item-link field, an option to allow duplication if parent item is duplicated. This will allow to have some tracker behaving one way and other trackers the other way.
  - Option3: When duplicating an item a check if children exist and if yes a modal(option/selection screen with a checkbox: "Do you want to duplicate also this item children" (y/n checkbox)

- What should be the default ?
- The clone action in the plugin ListExecute ?

**Solution**

Reminder: This code/feature is here since 2012 so people may use it as is.

- I added some documentation to
  - https://doc.tiki.org/Tracker-Settings
  - https://doc.tiki.org/PluginListExecute

While we want a better Tiki, we need to be aware of the "how many people use this" as it doesn't make sense to create extra work and extra complexity for a handful of people.

I would really have preferred a per action selection (which allow awareness of an existing option to the admin without having to read the documentation), but it looks to me like a lot of work and maintenance.

A option on the item-link options is ok as it allow more granularity (per case). However the item-link option a really crowded.

(by the way, shouldn't the "Cascade" be a way to allow or disallow children duplication ?)

A global option (a child preference of the Duplicate option) is an easy win and includes the ListExecute case.

IMO the default should be off, "don't duplicate children items" to avoid a silent creation of items.

One big complex site I work on uses item cloning and they are very happy that all children tracker items are duplicated together with the one which they duplicate. Except for one particular item which they did not want to create duplicates and I needed some ugly code workaround for it.

So, I like the idea of « Option2: As it related to the item-link field, an option to allow duplication if parent item is duplicated. This will allow to have some tracker behaving one way and other trackers the other way. » because we need the granularity.

I disagree with adding this to "cascade" because cascade has all combinations of cascade options. There are 8 combinations and this would add 5 more!!! So I suggest a checkbox just above the cascade because it is related to cascading. IMO the default should be "duplicate items if parent item is duplicated" for backwards compatibility. Otherwise people who upgrade will have issues. Since the config is done on the child, the message should not mention children but parent (viewpoint issue).

Also, I agree the feedback could be improved with some message mentioning exactly how many items were just created.

Maybe option 3 would also make sense but then the end user cloning the item makes the decisions instead of the admin who configures Tiki. I can't make up my mind: It could be nice or it could be annoying extra work with possibility for mistakes if you need to do a lot of cloning.

The use case is people doing complex tracker items with child items (and children of child items). The next year they mostly do the same things so cloning everything with a different value in the "year" and "title" fields makes sense. Then they switch status to "pending" so it's invisible to non-admins, they review everything and make changes as appropriate and then they switch status to "open" so everybody sees it. Et voilà, all done! (Yes, status is cascaded.)
Thank you for your feedback.
I mostly agree with your comment. (but the option should be below Cascade and not above as you suggest ;-) )

- Like you, I’m not sure about option 3 (nicer or annoying) and the safe way is an additional option near “Cascade”.
- I also wish we improve the help and tooltip (add your salt please ;-) )

Also, *I agree the feedback could be improved with some message mentioning exactly how many items were just created.*
- That would be awesome!

We need a second cascade action or option.

---

Improving Cascade tooltip:
Cascade actions include the value of the field and the status. When the master/parent field value (in the other tracker) is updated or deleted the slave/child is affected and it is the same for the item status.

*Categories may conflict if multiple item links are used to different items attempting to manage the same categories. Same for status.*

<= What the hell does that mean... pretty hard to understand for the end-user. []

---

A new checkbox;
Duplicate cascade action (checked by default so we keep the previous behaviour):
When the master/parent is duplicated (see Duplicate tracker items settings), a duplicated slave/child will be silently created in the “other” tracker (Tracker to link to).

---

On the Trackers admin: tiki-admin.php?page=trackers
Duplicate tracker items
Info : Duplicate tracker item information to a new tracker item. If a (parent) item has an item-link linked to another tracker, a new child item will be automatically created . This last can be turned on and off per case on the item-link tracker fields options of the parent item.

---

I wonder about backporting... As principle, it will be good it is on our Tiki24 as it is LTS.
