Description
        Context: I have a Tiki24 I updated today (3 weeks commits) where a Plugin Register Member
        Payment stopped to work.

        I tested on real life Tiki24 (upgrade).
        I tested on a new Tiki 24 install
        I tested on a new Tiki 24 install on my local
        I re-tested on local using firefox and chrome.

        When registering a new user has a white page on submit.
        php_error.log empty

        apache_ssl_access.log
        ```
        ::1 - - 19/Dec/2022:13:52:48 +0200 "POST /tiki-register.php HTTP/1.1" 200 -
        ```

        apache_ssl_request.log
        ```
        19/Dec/2022:13:52:48 +0200 ::1 TLSv1.2 ECDHE-RSA-AES128-GCM-SHA256 "POST /tiki-
        register.php HTTP/1.1" -
        ```

        I tested on a new Tiki25 install on my local and it is working fine.

Tested on the show instance with the same results, WSoD.

Comments

Bernard Sfez / Tiki Specialist 22 Dec 22 14:00 GMT-0000

Same behaviour on the show instance.

Michel Ram 10 Mar 23 16:00 GMT-0000

I had this exact issue today on my tikiwiki install. And if anyone is interested, I was able to pinpoint this issue to chosenGroup variable in the registration parameters.

In tiki24.3 the register_new_user_local() function in "lib/registration/registrationlib.php" calls the add_user() function from userslib.php which has the optional variable "$groups".

In tiki 21 this variable was not passed along from this function in registrationlib.php.
In tiki24 it is and it is [registration['chosenGroup']]. It is not checked if the variable registration['chosenGroup'] was actually set (with the php isset() function).

Instead of an empty array [], this now passes an array with a single element ['']. Inside userslib.php the add_user() group now enters a foreach loop, that fails when trying to add the new user to group ''.

I added a workaround in my local tikiwiki 24.3 site by patching the following 2 lines

⌨⌨⌨⌨⌨⌨

diff -crN old/lib/registration/registrationlib.php new/lib/registration/registrationlib.php *** old/lib/registration/registrationlib.php 2023-03-10 16:15:05.231194121 +0100 --- new/lib/registration/registrationlib.php 2023-03-10 16:15:05.203194643 +0100 *************** *** 395,401 **** $apass, $openid_url, $this->merged_prefs['validateRegistration'] == 'y' ? 'a' : 'u', ! [$registration['chosenGroup']]); //returns the user login and set as name. this is in case the name is generated in the add user (autogenerated login for eg) if ($registration['name']) { $_REQUEST['name'] = $registration['name']; // update in case auto-generated --- 395,401 ---- $apass, $openid_url, $this->merged_prefs['validateRegistration'] == 'y' ? 'a' : 'u', ! isset($registration['chosenGroup']) ? [$registration['chosenGroup']] : []); //returns the user login and set as name. this is in case the name is generated in the add user (autogenerated login for eg) if ($registration['name']) { $_REQUEST['name'] = $registration['name']; // update in case auto-generated *************** *** 413,419 **** } } else { if (! $confirmed) { ! $registration['name'] = $userlib->add_user($registration['name'], $newPass, $registration['email'], '', false, null, $openid_url, null, [$registration['chosenGroup']]); if ($registration['name']) { $_REQUEST['name'] = $registration['name']; // update in case auto-generated } --- 413,420 ---- } } else { if (! $confirmed) { ! $registration['name'] = $userlib->add_user($registration['name'], $newPass, $registration['email'], '', false, null, $openid_url, null, ! isset($registration['chosenGroup']) ? [$registration['chosenGroup']] : []); if ($registration['name']) { $_REQUEST['name'] = $registration['name']; // update in case auto-generated }

Michel Ram 10 Mar 23 16:48 GMT-0000

I noticed this is already fixed in the current trunk.

Marc Laporte 14 Mar 23 09:48 GMT-0000

ok, so if someone can find out which commit(s) solved it, we could backport.

How to figure out which commit causes a bug

https://gitlab.com/tikiwiki/tiki/-/commits/master

Michel Ram 15 Mar 23 09:38 GMT-0000

I believe this commit solved the issue.
https://gitlab.com/tikiwiki/tiki/-/commit/01975d6088942fdd5236acd0d14c6658bda21a90

I have not tested it on this exact commit, but I have a similar fix in place in my own tiki-site (as shown in the comment above)

Marc Laporte 15 Mar 23 18:34 GMT-0000

@Michel Ram

Can you contribute some merge requests to backport to 25x and 24x?

Thanks!

Michel Ram>Marc Laporte 16 Mar 23 13:36 GMT-0000

Replied to
24.x is now merged and 25.x already had the fix in place. So I believe this issue can be closed.
