Description
We have a long table that presents fine on initial display, but when presented as (cached) the data is truncated. The footer appears mostly as normal except that it's evident that the table elements are arbitrarily cut off thereby affecting the subsequent footer.

Our table where the error is occurring is 680 lines long. The table will be truncated somewhere around line 390 or 540 but for a given edit instance it will always truncate at the same place.

We are seeing this behavior in 1.9.1 and 1.9.5. I don't believe this is a browser-related issue because we are seeing virtually the same results in IE and Firefox.

Solution
We had the same problem on doc.tikiwiki.org
Fixed by Sylvie in 1.9.8
