Description

I've added the following features to my tikiwiki 1-9-5:

1. added max_depth to
with I can limit the depth of the toc created. This is convenient if I only want to show the next level of subsections.
2. get a file by name via tiki-download_file
with galleryId=<id>&name=<?> I can retrieve a file by name. If there are files with the same name the most recent is taken. This is convenient as I can reference the files by there name, e.g. schedule, an I can easily update it with out changing pages. Dynamic content would also work but I prefere the name as it is more obvious than 'content id=42'
3. get a random picutre from a gallery via show_image
with galleryId=<id> a random picture of the identified gallery is given.

Solution

see attached patch

jar240 12 Jan 10 17:32 GMT-0000

Was this or something similar ever implemented into the core functionality?
