Description

If you have categories and sub-categories like the following:

```
try
try::tt
try2
try2::tt
```

The try::tt sub-category will be placed under parent try instead of parent try2.

This is because the ksort(\$ret) towards the end of get_all_categories_respect_perms in categlib sorts try::tt after try2::tt (since ':' comes after "2" in the ASCII table).

Solution

committed to categlib and tiki-admin_categories.php
