Description

People tend to make the comment that adding images in wiki docs is a tedious process - compared to what they are used to in other (local) applications/editor. Most of which support drag & drop of images directly in the editor.

I reply that this is a web application and not a local application. Few people are satisfied with this explanation.

Drag & drop of images in the - especially in the WYSIWYG editor - would be really nice.

The dropped files should be stored in the File Gallery, I guess. Once dropped Tiki should automatically insert the image tag at the drop location in the editor.

The user must be able to open the image properties to configure the image settings afterwards.

Solution

The new Elfinder drag and drop implementation is close enough

After testing ScreenCapture it does make using images a lot easier. (Though it currently does not work in WYSIWYG). However, it is not the use case the user is familiar with, and it will require that the user discovers this function or training. It also requires that the "Screencapture" menu option is manually added by the admin to the editor toolbar.

So, I still consider this an open wish.

To make Screencapture more accessible, I suggest

- 1) Make it jcapture work in WYSIWYG
- 2) Automatically add Screencapture to the editor toolbar when the feature is activated.

Marc Laporte 06 Oct 12 17:44 GMT-0000

1 -> on todo

2 -> It's there on the default toolbar (so reset yours to the default, or try a new install)

Arild Berg 06 Oct 12 19:56 GMT-0000

2....I did a reinstall-db on the latest trunk. The screencapture icon is still not present.

Arild Berg 08 Oct 12 10:06 GMT-0000

I forgot to activate jcapture. Once it was activated it came up on the toolbar ok.
