Description

We have a global permission tiki_p_list_trackers that should allow or deny groups to be able to see the list of trackers (tiki-list_trackers.php). This permission is only listed in the global permission (not object) so it is definitely all trackers.

Tested with a fresh Tiki25.x

See in the attached video:

It seems this permissions is simply ignored.

1. Visiting the tracker list page as anonymous I can see the tracker list page with an empty table. What a un-happy UX/UI...When the is nothing to see, the user/visitor should clearly see nothing ? and eventually the reason he sees nothing. Not an empty table.
2. If you change the object permission "tiki_p_view_trackers" for a tracker, it will be listed.

Doesn't make sense to me.

See my suggestions in the Solution field below.

before test in Tiki25

Solution

1. When a group doesn't have "permission tiki_p_list" he simply shouldn't be able to see the table or page content, but a message *You don't have permission to list the trackers.*
2. When user/visitor load tiki-list_trackers.php that lead to an empty table, he shouldn't see the table or page content but a message *You don't have permission to list the trackers.*

Sorry, i don't follow **@Bernard Sfez / Tiki Specialist**, if there's no global perm set the object perms take over, which is what it should be i think.

If the global is set then trackers without object perms will obey that - looks fine to me sorry... `/me goes to get more coffee`

Hi **@Jonny Bradley**,

I read you and agree with "if there's no global perm set the object perms take over".

But we have here 2 distinct permissions;

- `tiki_p_list_trackers` (right to see the tracker list page) <- this one is only global (not to be found on object permissions)

- tiki_p_view_trackers (right to view the tracker)

If the purpose of tiki_p_list_trackers is not to hide the trackers list, then what could it be ?

And, if this is the case, tiki_p_list_trackers has actually no effect. (you can always see the trackers list page... even empty)

It is not just arguing for pleasure. But I found several cases of Tikis where admins want users to view fields name, items and values in the tracker items view or in other interface with minimum exposition. They don't want user to see all their different public trackers listed.

Using the tracker properties permission "Restrict non admins to wiki page access only " is not a solution as it close access to the item from the tracker view.

Does that clarify the issue ?
